

Constraint-based signed-graph partitioning (fixed)

Fix: 2-color the contradiction graph first, then Union-Find SUPPORTS/REFINES only within the SAME color. A2+X2 form one partition; C2 is forced into a different partition.

Naive partitioning (remove CONTRADICTS, take connected components)

Bug: A1, X1, C1 land in ONE partition once CONTRADICTS is dropped -- violates the no-contradiction-within-partition invariant.
